The sequence is that of a Borrelia burgdorferi surface antigen p39. clone 7-1 polypeptide. It can be used in the production of p39.5 or fragments of it which may be used to raise antibodies to, and in the development of vaccines against lyme disease. The sequence can also be used for making primers and probes for diagnosis, also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a Borrelia burgdorferi surface antigen p39.5 calone 14-1 polypeptide. It can be used in the production of p39.5 or fragments of it which may be used to raise antibodies to, and in the development of vaccines against Lyme disease. The sequence can also be used for making primers and probes for diagnosis, also in DNA vaccines, as antisense therapeutics and for drug screening. Antibodiescan be used as diagnostic (immunoassay) reagents, for treating Lyme disease, for affinity purification, for drug screening and to produce anti-idiotype antibodies (used in the same way as p39.5 to induce an immune response).
                                                                                                             New nucleic acid encoding the P39.5 antigen of Borrelia burgdorferi - and related vectors, transformants, antibodies and polypeptides, for diagnosis, prevention and treatment of Lyme disease

Antibodies can be used as diagnostic (immunoassay) reagents, for treating Lyme disease, for affinity purification, for drug screening and to produce anti-idiotype antibodies (used in the same way as P39.5 to induce an immune response).

                                                                                                                                                                                                                                                                                                                                          This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Borrelia burgdorferi nucleic acids products for the diagnosis, prevention and treat caused by Borrelia, particularly Lyme disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Choi GH,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.

The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.

                                              28-kb linear plasmid, pBB28La, of B. burgdorferi B31 contains a vmp-like sequence (v18) locus consisting of 15 silent vls cassettes (see AAT85043) and the expressed vlsE gene. Portions of several of the 15 silent vls cassette sequences, located approx. 500 bp upstream of vlsE, recombine into the central vlsE cassette region
                                                                                                             major protein (VMP)-like protein VISE of Borrelia burgdorferi. sequence was deduced from an isolated visE gene (see ATR85042). elaborate genetic system has been identified that promotes extensive antigenic variation of VISE. An infectivity related
                                                                                                                                                                                                                    Nucleic acid encoding variable major protein-like Borrelia - useful for recombinant production of v peptide, or for diagnosis of Lyme disease
            Recombinant
                     during infection, resulting in antigenic variation and hence immune evasion, long-term survival and pathogenesis in the mammalian host.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly I-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression puttern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, raccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the exemption.

A A

acid sequence of PHA acetoacetyl-CoA reductase.

The invention provides polyhydroxyalkanoate (PHA) biosynthesis-related genes. Specifically, these are the genes for PHA synthase (AAX86966), PHA beta-ketotholase (AAX86967) and PHA acetoacetyl-CoA reductase (AAX86968), derived from Alcaligenes latus. The genes are contained in fragment of 6436 nucleotides (AAX86965. The genes are used to produce recombinant proteins, which are used for PHA biosynthesis. PHA can then be used to produce biodegradable polymers, which can be used as an alternative to plastic. The production cost of PHA is much higher than those of other commercially available synthetic polymers. The present invention allows the recombinant production of PHA, which results in cheaper PHA production costs. The present sequence represents the amino

erythematosus, and myasthenia gravis; infections and trauma. Antagonists of the HTRM polypeptides are useful for treating or preventing disorders associated with increased expression or activity of HTRMs. HTRM polypeptides, their immunogenic fragments or oligopeptides are useful for screening libraries of compounds in drug screening techniques. Polynucleotides encoding HTRM are useful for blocking the transcription of mRNA and regulating gene function by modulating the activity of HTRM. Vectors expressing HTRM or agonists can also be used to prevent or
                                                                                                                                    treat disorder associated with decreased HTRM expression. Antibodies which specifically bind HTRM and polynucleotides encoding HTRM are useful for diagnosing disorders associated with the expression of HTRM, particularly in assays that detect the expression of HTRM. Nucleotide sequences encoding HTRM may be useful to generate hybridization probes useful in mapping the naturally occurring genomic sequence and to detect differences in gene sequences among normal, carrier and affected
Sequence
                                                individuals. Using diagnostic assays, cancer can be detected the appearance of clinical symptoms and thereby progression obe prevented by aggressive treatment or preventive measures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mellitus, rheumatoid arthritis, multiple sclerosis, systemic
